

Sample Test Document

Introduction

This is a sample PDF created for testing document loaders and text splitters in LangChain. It contains multiple paragraphs and pages so you can verify that your PDF loading, chunking, and splitting logic works as expected.

About Text Splitting

Text splitters break large documents into smaller chunks so they can be processed by language models more effectively. A good text splitter respects chunk size limits and can overlap chunks slightly to preserve context between them. Common strategies include splitting by character count, by sentence boundaries, or by semantic meaning.

When working with LangChain, the `CharacterTextSplitter` and `RecursiveCharacterTextSplitter` classes are commonly used. They allow you to specify a `chunk_size` and `chunk_overlap` parameter, which control how the text is divided and how much context is shared between adjacent chunks.

Page Two

This is the second page of the sample document. Loaders like PyPDFLoader in LangChain typically load each page as a separate Document object, complete with metadata such as the source file name and page number.

Feel free to use this file to test loading, splitting, embedding, or any other processing step in your pipeline. Since it is plain generated text, it should parse cleanly without any special formatting or encoding issues.
